

Corrected-reference LJ-13 temperature-transfer result. All observables use the same fixed 2,000 configurations without filtering. Lower is better.

Metric	Direct FM	AM mean $\pm$ SD	AM wins	Verdict
Energy W_2	1.343121	1.508057 ± 0.115961	0/3	negative
Geometric W_2	3.005161	3.013798 ± 0.003287	0/3	negative
Pair-distance W_2	0.040800	0.042236 ± 0.003034	1/3	mixed
Radius-of-gyration W_2	0.027494	0.028268 ± 0.002072	1/3	mixed
Minimum-pair W_2	0.012508	0.010450 ± 0.000576	3/3	auxiliary

AM uncertainty is the sample standard deviation across three independent AM optimization seeds conditioned on one shared FM seed-0 controller. It is not end-to-end three-seed uncertainty. The registered result is negative because none of the AM seeds improves either primary metric (Energy or Geometric W_2). The minimum-pair improvement does not change the primary verdict.
